Does auxiliary power increase with ship size?

A small local survey of ships provides useful data on auxiliary power demand. Operating auxiliary engine power does not necessarily increase with ship size. The auxiliary power scheme can strongly affect the estimated emissions, were specified by ship type and operating mode. Auxiliary boiler power was generally not differentiated by ship size.

Do ships need auxiliary engines?

Ships are required to have more than one auxiliary engine to ensure continuous power. If one fails, another can start automatically. In emergencies, emergency generators take over to power essential systems. Many cargo handling systems, especially on container ships and tankers, are powered electrically.

Can auxiliary boiler power be differentiated by ship size?

Auxiliary boiler power was generally not differentiated by ship size. More recent approaches are based on extensive ship survey data, and give tables of auxiliary engine and auxiliary boiler power binned against ship type, ship size and operating mode.

Why do vessels use shore-generated power instead of auxiliary diesel engines?

By using shore-generated power instead of running auxiliary diesel engines, vessel operators enjoy a fuel cost benefit, the magnitude of which depends very much on the going fuel price.

Therefore, the effect of switching conventional auxiliary engines (AEs) with dual fuel AEs used as power generation on container ...
